

Polymarket BTC Bot

version 7.1 — Conviction Engine

Every 2 seconds · 24/7 · Fully automated

An automated trading bot that exploits speed advantages and price mispricings on Polymarket's 15-minute Bitcoin markets. It watches BTC on Binance, spots when Polymarket hasn't caught up, and trades before anyone else.

\$154 → \$1,500+

First Day Results

46% Win Rate

12 Wins / 14 Losses

3.4x Payoff

Avg Win \$117 vs Avg Loss \$34

26 Trades

Across 4 Hours

The Market

Every 15 minutes, Polymarket opens a simple question: **"Will Bitcoin's price go up or down in the next 15 minutes?"** You can buy YES tokens (betting up) or NO tokens (betting down). If you're right, each token pays \$1.00. If you're wrong, your tokens expire worthless.

The tokens trade between \$0.01 and \$0.99, reflecting what the crowd thinks the probability is. If YES tokens cost \$0.50, the market thinks there's a 50/50 chance BTC goes up. If they drop to \$0.15, the market thinks there's only a 15% chance — but if you buy at \$0.15 and you're right, you just turned \$0.15 into \$0.98 (after fees). That's a 6.5x return.

*The bot's entire edge comes from finding moments where these prices are **wrong** — when BTC has already moved but the market hasn't caught up yet.*

Buying cheap tokens creates massive asymmetry. A \$0.10 token pays 9.8x if it wins. You only need to be right 10% of the time to break even.

Five Strategies, One Goal

Each strategy looks for a different type of market mispricing. They run simultaneously, and when multiple strategies agree on the same side, the bot increases its bet size — a signal it calls **conviction**.

■ LATENCY	6% of balance
The proven money maker. Watches BTC on Binance — when it moves 0.1%+ but Polymarket prices haven't updated, buys the underdog.	
Your best trade: +\$647 from a single Latency entry at \$0.21. No confirmation delay — speed is the entire edge.	
◆ FLASH	4% of balance
Buys tokens when they drop to extreme discounts (\$0.05–\$0.28). Markets often overreact to small BTC moves, pushing one side way too far.	
Only buys when BTC shows signs of moving in the cheap side's direction. Wins less often, but each win pays 3–10x the bet.	
◆ SQUEEZE	5% of balance
Late-game lottery tickets. In the final 5 minutes, one side often drops to \$0.05–\$0.15. If BTC shows any sign of turning, buys a small bet on the other side.	
Your second-best trade: +\$319 from a Squeeze entry at \$0.095. High risk per trade, but 5–10x payout when it hits.	
■ MOMENTUM	5% of balance
Detects explosive BTC moves — 0.15%+ in under 10 seconds. Whale orders, liquidation cascades, news spikes. These create massive price spikes.	
Tight thresholds mean it fires rarely. When it does, the signal is extremely strong.	
◆ ARB	5% of balance
Pure math. When YES + NO prices add up to less than \$0.96, there's guaranteed profit. Buys the cheaper side — direction doesn't matter.	
Lowest risk, lowest reward. The only strategy exempt from trend rules because it doesn't predict direction.	

The Brain: Trend Engine

Every second, the Trend Engine analyzes BTC across multiple timeframes and classifies the market into a **regime**. This single classification controls everything — which strategies can fire, what direction they can trade, and how much they bet.

Regime	What It Means	What the Bot Does
TRENDING UP	BTC clearly rising (1m, 5m, 15m all positive)	Only buys YES. Blocks all NO trades.
TRENDING DOWN	BTC clearly falling	Only buys NO. Blocks all YES trades.
BREAKOUT	Explosive move with high volatility	Trades with the direction. Faster entry thresholds.
FLAT	BTC going sideways, low volatility	Only ARB trades. Directional strategies wait.
CHOPPY	High volatility but no direction	Most strategies pause. Too unpredictable.

The critical rule: **never bet against the trend**. Your data showed 0 wins out of 6 counter-trend trades. When the regime says TRENDING UP, the bot physically cannot buy NO — no exceptions, no overrides. This single rule prevented the biggest loss pattern.

Intelligence Layer

System	What It Does
Conviction Engine	When 2+ strategies agree on the same side, boost bet size by 1.5x. Three or more agreeing = 1.8x.
Momentum Guard	Tracks how long BTC has been moving in one direction. After 3+ minutes sustained, blocks ALL counter-trend trades.
Win Streak Sizer	After 3 consecutive wins: 1.2x size. After 4: 1.3x. After 5+: 1.4x. Captures hot streaks when conditions align.
Adaptive Sizer	Tracks each strategy's win rate over the last 30 trades. Winning strategies get up to 2.5x their base size.
Time-of-Day	Tracks win rate per UTC hour. Hours with 55%+ win rate get 1.2x boost. Hours with less than 30% get 0.5x.
Bad Hour Detection	If a specific hour has less than 35% win rate over 5+ trades, directional strategies pause for that hour.

Risk Protection

The bot is designed to survive bad days. Five layers of protection prevent catastrophic losses, and the 30-second entry gap stops the most dangerous pattern: firing 4 trades simultaneously on the same wrong signal.

Protection	Rule	Why It Matters
Global Cap	Max 7 positions open at once	Limits total exposure across all markets
Per-Market Cap	Max 5 positions on one 15-min market	Prevents over-concentrating on one outcome
Balance Cap	Max 25% of balance on one market	One bad market can't wipe you out
Entry Gap	30 seconds between trades on same market	First trade must prove itself before adding more
Counter-Trend Block	Cannot bet against the regime direction	0% win rate on counter-trend = blocked entirely
Side Lock	All trades on a market must be same direction	Prevents betting both sides and guaranteeing loss
Streak Pause	5 consecutive losses pauses strategy 30s	Stops strategy from digging a deeper hole

Position Sizing

Every trade is sized as a percentage of your current balance. As your account grows, trades grow automatically. As it shrinks, trades shrink to protect you. On top of the base percentage, multipliers from the intelligence layer stack to amplify high-conviction trades.

Balance	Latency (6%)	Flash (4%)	Squeeze (5%)	ARB (5%)
\$200	\$12	\$8	\$10	\$10
\$500	\$30	\$20	\$25	\$25
\$1,000	\$60	\$40	\$50	\$50
\$1,500	\$90	\$60	\$75	\$75
\$3,000	\$180	\$120	\$150	\$150

These are base sizes. With conviction (1.8x), win streak (1.4x), and trend boost (1.5x) all stacking, a single trade can reach ~3.8x the base. A 12% hard cap per position prevents any single trade from exceeding that threshold.

Actual Results

First day: \$154 starting balance grew to \$1,500+ in one session. The bot won 46% of trades but profited because average wins (\$117) were 3.4x average losses (\$34). 77% of all profit came from the top 3 trades — this is expected for asymmetric strategies. You don't need to win often. You just need the wins to be big.

Data Collection

The bot generates detailed CSV logs for every trade and every market. This data feeds back into the adaptive sizer and lets you analyze exactly what's working.

File	What It Contains
trade_log.csv	25 columns per trade: timestamp, strategy, side, entry price, shares, cost, P&L, regime, trend, volatility
market_log.csv	One row per 15-min market: total trades, wins/losses, P&L, BTC open/close, which strategies fired, volatility
trade_data.json	Machine-readable history for the adaptive sizer. Tracks per-strategy win rates and hourly performance
trade_history.txt	Human-readable log of every trade with timestamps and P&L
polybot.log	Debug log for troubleshooting orders, connections, and errors

Running the Bot

Step	Command
Install dependencies	<code>pip install py-clob-client python-dotenv requests numpy colorama web3</code>
Create .env file	<code>PRIVATE_KEY=0x... FUNDER_ADDRESS=0x... SIGNATURE_TYPE=1 DRY_RUN=false</code>
Start the bot	<code>python3 polymarket_btc_bot_v7.py</code>
Run in background	<code>screen -S bot python3 polymarket_btc_bot_v7.py Ctrl+A, D to detach</code>
Reattach	<code>screen -r bot</code>
Stop	<code>Ctrl+C (shows session summary)</code>

The bot auto-detects your balance from Polymarket on startup. No manual configuration needed beyond the .env file. Just deposit USDC and run.
